Data Analytics Project

1. Project Overview

Amazon Sales Analytics is an interactive Power BI project developed to analyze sales performance from multiple business perspectives. The report provides an executive overview and dedicated analyses of products, customers, geography, and business insights.

2. Project Objectives

- Analyze overall sales and order performance.
- Identify high-performing products, categories, and brands.
- Understand customer and revenue contribution.
- Analyze geographic sales performance.
- Present key findings and recommendations through an interactive dashboard.

3. Tools and Technologies

- Microsoft Power BI – dashboard development, visualization, filtering, and reporting.
- Power Query – data preparation and transformation.
- DAX – analytical measures and calculations.
- Source dataset – used for sales and business analysis.

4. Data Preparation and Analysis

The source data was reviewed and prepared for analysis before dashboard development. Relevant sales, order, quantity, product, customer, brand, category, date, location, and fulfillment fields were used to build the analytical views.

- Reviewed the dataset structure and relevant analytical fields.
- Prepared data for visualization in Power BI.
- Created measures required for KPI cards and analytical visuals.
- Used slicers and filters for interactive exploration.
- Applied readable number formatting using K and M notation where appropriate.

5. Dashboard Structure

Home Page

Provides a simple project introduction and navigation to the five analytical dashboard sections.

Executive Dashboard

Provides a high-level view of sales performance using KPI cards and supporting visuals. It allows users to quickly understand revenue, orders, quantity sold, and overall performance.

Product Analysis Dashboard

Focuses on product and brand performance, including revenue contribution, quantity sold, average selling price, categories, and top-performing products.

Customer Analysis Dashboard

Analyzes customer performance and revenue contribution, including the leading customers and customer-related purchasing patterns.

Geographic Analysis Dashboard

Examines sales performance across geographic locations using map-based and supporting visuals to identify important regions.

Insights Dashboard

Summarizes the main findings from the analysis and presents business-focused recommendations for easier management-level interpretation.

6. Key Findings

- Total revenue reached approximately 91.83M.
- The report covers approximately 100K orders and 300K units sold.
- Revenue remained relatively stable from 2020 to 2024, with 2023 reaching approximately 18.51M.
- Electronics generated approximately 15.58M in category revenue and was the leading category shown in the analysis.
- Top customers generated approximately 0.51M–0.55M each, highlighting the contribution of high-value customers.
- Texas was identified as a leading state in the geographic analysis.
- Delivered orders represented approximately 74.63% of orders in the fulfillment analysis.

7. Business Recommendations

- Continue monitoring high-performing product categories and brands to support revenue growth.
- Identify and retain high-value customers through customer-level performance monitoring.
- Review geographic performance to identify regions with opportunities for stronger sales.
- Monitor fulfillment performance and investigate opportunities to improve non-delivered orders.
- Use yearly and product-level trends to support sales planning and inventory decisions.
- Regularly monitor dashboard KPIs to identify changes in business performance.

8. Dashboard Design

The dashboards use a dark, modern visual style with Amazon-inspired accents. Different accent colors distinguish the analytical pages while maintaining a consistent overall layout.

- Simple Home page with navigation cards.
- Consistent navigation across dashboard pages.
- KPI cards for quick performance monitoring.
- Interactive slicers and filters.
- Clear chart titles and readable number formatting.
- Dedicated Insights page for findings and recommendations.

9. Conclusion

The Amazon Sales Analytics project transforms sales data into an interactive Power BI reporting solution. The completed dashboards provide complementary views of executive performance, products, customers, geography, and business insights. The report makes important sales patterns easier to understand and provides a structured basis for data-driven business analysis.

10. Dashboard Screenshots

Insert the final screenshots of the completed Home, Executive Dashboard, Product Analysis Dashboard, Customer Analysis Dashboard, Geographic Analysis Dashboard, and Insights Dashboard in this section.
